## CHEVROLET V-8 ENGINES INTRODUCTION

The Chevrolet V-8 engine was introduced to the motoring public in 1955. It quickly became a favorite of hot rodders and racers all over the country. The Chevy V-8 has undergone many refinements and modifications throughout its history, but it has remained a very popular engine among performance enthusiasts.

The Chevrolet V-8 was first introduced as a 265 cubic inch displacement (CID) engine in 1955. This was the first in a long line of engines we now know as Small Block Chevys. Chevrolet introduced the "W" series engine in 1958, starting out at 348 CID. This was eventually increased to the now legendary 409 engine. The Big Block Chevy was introduced in 1965, beginning at 396 CID. Numerous modifications have been made over the years to the big block. Table 1 indicates the years of production for the various sizes of Chevrolet V-8 engines.

Cubic Inch Displacement	Years of Production	Engine Type
-------------------------	---------------------	-------------

262	1975-1976	Small Block
265	1955-1957	Small Block
267	1979-1982	Small Block
283	1957-1967	Small Block
302	1967-1969	Small Block
305	1976-Date	Small Block
307	1968-1973	Small Block
327	1962-1969	Small Block
348	1958-1961	W Series
350	1967-Date	Small Block
366	1966-1979	Truck Big Block
396	1965-1969	Big Block
400	1970-1980	Small Block
402	1970-1972	Big Block
409	1961-1965	W Series
427	1966-1969	Big Block
427	1966-1979	Truck Big Block
454	1970-Date	Big Block

## CHEVROLET V-8 ENGINE IDENTIFICATION

Identifying a Chevy V-8 engine is not simply a matter of checking the engine suffix code. Chevrolet reused (perhaps recycled is a better word) engine suffix codes from one year to the next. It is not uncommon to find an engine suffix code that represents a high horse power big block engine one year; and have the very same engine suffix code represent a low horse power small block engine the next year.

The correct method for identifying an engine by the suffix code is a two part process. Step one is to identify the model year (not necessarily the calendar year) of the engine. This is done by locating and deciphering the engine casting date code. The block casting number may also be of benefit in helping to determine the date range of a particular engine.

Step two is to match the engine suffix code, and the date code, with the engine suffix codes listed in this book. This will accurately identify the engine as to cubic inches, horse power rating, equipment, and vehicle application.

A special note concerning the "truck big block" engine is appropriate here. The 366 and 427 "truck" engines are different block castings than the automobile big block engines. These blocks are not interchangeable. The 366 / 427 truck blocks are approximately 0.4 of an inch "taller" than the automobile big blocks. Engine suffix codes listed for 366 and 427 engines, where the automobile type is identified as "TR", are truck big block engines.

## CHEVY V-8 ENGINE PLANT STAMP FORMAT

The Chevrolet engine plant stamp format has changed somewhat over the years, but it provides a wealth of information for those who know how to read it. All 1955 and most 1956 Chevy V-8 engines used an engine plant stamp format like the following:

0I04563F56FG which breaks down to:  
0I04563 = the sequence number of the engine  
F = the engine plant (Flint, Michigan)  
56 = model year of engine production  
G = engine suffix code

Late in the 1956 model year, Chevrolet changed the format of the engine plant stamp. The revised format for 1956 simply deleted the engine sequence number, so the format would look like 'F56G'. The format was changed again for the 1957 model year. The new format has been used on all Chevrolet V-8 engines through 1991. The new format is:

T02I4IT which breaks down to:  
T = the engine plant (Tonowanda, New York)  
02I4 = engine assembly date (Feb. 14<sup>th</sup>)  
IT = engine suffix code

### Notes:

1. Leading zeros for the engine assembly month were not used from 1957 to mid January of 1960. The actual date of change appears to be between Friday January 15, 1960 and Monday January 18, 1960.
2. The letter 'T' is used in place of the digit '1' in pad stamps, except for the VIN derivative stamp.

## CHEVY V-8 ENGINE ASSEMBLY DATE

The engine assembly date is typically a three or four digit number, where the first one or two digits represent the month (1=Jan...12=Dec), and the last two digits represent the day of the month (01 to 31). It is important to note that the engine plants did not use the '1' character. The letter 'I' is used to represent a '1'. This is sometimes confusing, since the assembly date and the suffix code run together. As an example: a front pad stamp of 'F4IID' might be mistaken as having a suffix code of 'IID'. The actual suffix code in this case is simply 'D'. The 'II' represents the day of the month of engine assembly.

The Chevrolet engine plant designations are as follows:

F = Flint, MI (1955-1966)

V = Flint, MI (1967 and up)

T = Tonawanda, NY

K = St Catherine, Ontario, Canada

S = Saginaw, MI

M = Mexico

## **“CE” CHEVY V-8 ENGINE CODE**

Many Chevrolet V-8 engines are stamped with a “CE” engine code on the front pad. This “CE” code is usually followed by a series of digits. The stamping on the front pad does not follow the usual pattern of the engine plant, followed by the engine assembly date, followed by the engine suffix code.

The “CE” engine code is not really an engine code. “CE” stands for “Chevrolet Engine” and indicates that this engine is a service replacement engine. “CE” engines were used by dealerships to replace bad engines under warranty, as well as being sold to customers over the parts counter. The majority of “CE” engines were manufactured during the 1960s and 1970s.

It is not possible to determine what the engine type is on a “CE” engine. Chevrolet stamped the majoring of their replacement engines with “CE”, regardless of the engine type.

## ORIGINAL ENGINE DETERMINATION

It is often possible to determine exactly what vehicle an engine came out of. Chevrolet began stamping a derivative of the Vehicle Identification Number (VIN) on Corvette engines part way through the 1960 model year. The other Chevrolet assembly plants adopted this practice through the 1960s, so that by 1969 most Chevrolet engines had a VIN derivative stamped on them. The VIN derivative was stamped on the engine front pad in most cases; however, exceptions do exist. One notable exception is early 1969 Z/28 302 engines, which had the VIN derivative stamped on the side of the block, near the oil filter boss.

The VIN derivative is usually stamped with 1/8 inch tall characters. The engine suffix code, on the other hand, is usually stamped with 3/16 inch tall characters. The engine suffix code is stamped on the engine at the engine plant, before the engine is shipped to the vehicle assembly plant. The VIN derivative is stamped at the vehicle assembly plant, at the time of vehicle manufacture.

## ENGINE CODE CARBURETOR DESIGNATION

The format of a Chevy V-8 engine code is 1, 2, or 3 alphanumeric characters, usually located at the end of the assembly date. Chevrolet used 1 or 2 characters for suffix codes from 1955 through 1969. Engine codes from 1970 and up use 3 characters. However, exceptions to these rules do exist.

Many Chevy small and big block engines manufactured around 1966 had a three character engine suffix code, where the last character is an 'H' or an 'R'. This third character represents the carburetor type that was to be used on that engine. So, 'H' would represent Holley, and 'R' would represent Rochester. This situation appears to be true only for certain engines equipped with four barrel carburetors.

So, as an example, an engine with the following information:

Casting Date – B2766

Engine Code – IVR

would be a 1966 (determined from the casting date) 396 engine, rated at 325 hp, equipped with a Turbo-Hydramatic transmission, installed in a passenger car (the 'IV' portion of the engine code), *and equipped with a Rochester four barrel carburetor (the 'R' portion of the engine code).*
